AN INTERNSHIP REPORT ON

"IDENTITY SECURITY FRAMEWORK FOR AGRICULTURE"

SUBMITTED BY

MOHAMMED THWAHA ATP

VI BCA

Cyber Security,Ethical Hacking,Cloud Computing with IBM

Register No: 23BCCE137

UNDER THE GUIDANCE OF

MS. VIJAYALAXMI

Faculty Guide, Department of Computer Science

IN PARTIAL FULLFILLMENT OF THE REQUIREMENT FOR THE AWARD OF THE DEGREE OF

BACHELORS IN COMPUTER APPLICATION

MAY 2026

IBM Innovation Centre for Education

NCS Nihon Communication Solutions

CERTIFICATE

This is to certify that the project report entitled "Identity Security Framework for Agriculture" submitted by Mohammed Thwaha A T P (Register No: 23BCCE137) in partial fulfilment of the requirements for the award of the degree of Bachelor of Computer Applications is a bonafide record of project work carried out under our guidance and supervision.

The results presented in this report have not been submitted to any other university or institution for the award of any degree or diploma.

Ms. Vijayalaxmi
Faculty Guide
Department of Computer Science

Mr. Rathnakar Shetty
HOD
Department of Computer Science
Yenepoya Institute

DECLARATION

I, [Your Name], hereby declare that the project report entitled "Identity Security Framework for Agriculture" submitted to Yenepoya Institute in partial fulfillment of the requirements for the degree of Bachelor of Computer Application / Bachelor of Science is an original work carried out by me.
This report has not been submitted to any other university or institution. All information presented is true and correct to the best of my knowledge. References used for technical study are acknowledged in the References section.

Place: Mangalore
Date: _____

MOHAMMED THWAHA ATP
23BCCE137

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who supported me during the development and documentation of this project.
I am thankful to the Principal and management of Yenepoya Institute of Arts, Science, Commerce and Management for providing the academic environment and infrastructure required to complete this work.
I sincerely thank my internal guide [Guide Name] for valuable guidance, timely feedback, and encouragement throughout the project. The guidance helped me improve both the software implementation and the final documentation.
I thank the Department of Computer Science and all faculty members for their support during the course of study.
I am also grateful for the Cyber Security, Ethical Hacking and Digital Forensics programme framework, which helped me understand practical authentication, authorization, password security, and session management concepts.
Finally, I thank my family and friends for their patience and support throughout the project work.

MOHAMMED THWAHA ATP

CHAPTER 1
EXECUTIVE SUMMARY

For my final project under the Cyber Security, Ethical Hacking and Digital Forensics programme, I developed a web-based agriculture identity security system called AgriConnect. The project demonstrates how authentication and authorization can be implemented in a professional agriculture marketplace where buyers, sellers, and administrators have different access needs.

The system provides buyer registration, buyer login, staff login for sellers and admin, email OTP verification, seller approval, temporary seller password reset, product upload, buyer product viewing, user management, and activity log pages. Passwords are stored using Werkzeug password hashing, and the application uses SQLite for local persistent storage.

Background:

Agriculture platforms often connect many users such as farmers, produce sellers, buyers, and administrators. If identity is not handled securely, unauthorized users may access seller features, upload fake products, or view protected dashboards. This project addresses that risk through role-based login workflows and secure password storage.

Aim:

To build a working agriculture login and role management system that demonstrates password hashing, email OTP verification, session-based login, seller approval, and role-based authorization.

Technologies Used:

Python, Flask, Flask-Login/session authentication, SQLite, Werkzeug security utilities, smtplib with Gmail SMTP, Jinja2 templates, HTML5, CSS3, and local browser testing.

Key Outcomes:

- Created a complete agriculture-themed web interface with buyer, seller, and admin entry points.
- Stored user passwords as secure hashes instead of plain text.
- Added OTP-based second-step verification for buyer, seller, and admin login.
- Implemented seller approval so only approved sellers can upload agriculture products.
- Created SQLite tables for users, seller requests, products, and activity logs.
- Prepared design diagrams, database diagrams, process flow charts, and screenshot placeholders for academic presentation.

CHAPTER 2
INTRODUCTION

The project named Identity Security Framework for Agriculture is a Flask-based web application that demonstrates secure identity handling in an agriculture marketplace. The platform is presented as AgriConnect, where buyers can browse fresh produce, sellers can apply for approval and upload products, and the administrator manages seller approvals and users.
The focus of the project is authentication and authorization. Authentication answers the question 'Who are you?' and is handled through passwords and OTP verification. Authorization answers the question 'What can you do?' and is handled by separating users into Buyer, Seller, and Admin roles.

2.1 Background and Motivation

Digital agriculture systems increasingly handle user accounts, produce listings, seller identities, and buyer information. A weak login system can allow unauthorized access, fake seller activity, or misuse of dashboards. This motivated the development of a simple but meaningful identity framework where security is built into the login workflow.

2.2 Problem Statement

The problem addressed by this project is the lack of secure, role-based login workflows in small agriculture web applications. A basic username-password system does not clearly demonstrate modern security practices such as password hashing, second-factor verification, and server-side role checks.

- Plain text passwords are dangerous if the database is exposed.
- Password-only login can be misused if credentials are stolen.
- Seller access must be controlled because sellers can upload products visible to buyers.
- Admin pages must not be accessible to ordinary users.
- Activity logs are needed for future security auditing.

2.3 Objectives

- Build a web application using Python, Flask, and SQLite.
- Provide buyer signup with strong password validation.
- Hash all passwords before storing them in the users table.
- Use OTP email verification during login.
- Separate users into Buyer, Seller, and Admin roles.
- Allow sellers to request account approval before uploading products.
- Allow admin to approve seller requests and create temporary seller credentials.
- Allow sellers to reset temporary passwords after first login.
- Allow sellers to upload agriculture product details and images.
- Provide dashboards for buyer, seller, and admin users.

2.4 Scope of the Project

- Authentication System: buyer signup, buyer login, staff login, OTP verification, logout, and temporary password reset.
- Admin Module: view seller requests, approve sellers, view platform counts, and manage users.
- Seller Module: add product details, upload product image, and view own uploaded products.
- Buyer Module: view listed agriculture products uploaded by approved sellers.
- Database: SQLite database with users, seller_requests, products, and activity_logs tables.
- Security Controls: password hashing, strong password check, OTP verification, role-based routing, and sanitized file upload names.

The project is scoped as a locally running academic demonstration. Payment gateway integration, order processing, cloud deployment, automated activity logging, and production-grade account lockout are identified as future enhancements.

2.5 Assumptions and Constraints

Assumptions:

- Users have a valid email address to receive OTP messages.
- The application runs locally on a development machine.
- Gmail SMTP credentials are configured for email delivery.
- SQLite is acceptable for academic demonstration and low-volume testing.

Constraints:

- The current project uses local SQLite rather than a production database server.
- Email delivery depends on internet connectivity and SMTP configuration.
- The report includes screenshot placeholders because automated browser capture is not available in this environment.
- Some advanced security controls, such as account lockout and CSRF tokens, are recommended for production hardening.

CHAPTER 3
TECHNOLOGIES USED

This chapter explains the hardware and software environment required to develop and run the project.

3.1 Hardware Architecture

Component	Minimum	Recommended
Processor	Intel Core i3 / AMD Ryzen 3	Intel Core i5 / AMD Ryzen 5 or above
RAM	4 GB	8 GB or above
Storage	500 MB free space	2 GB free space for project, images, and reports
Display	1366 x 768	1920 x 1080
Network	Required for OTP email	Stable internet connection for Gmail SMTP

3.2 Software Architecture

Layer	Technology	Purpose
Backend	Python	Core server-side programming language.
Web Framework	Flask	HTTP routing, request handling, sessions, and template rendering.
Authentication	Werkzeug Security	Generate password hashes and verify submitted passwords.
Session Handling	Flask session / Flask-Login style workflow	Maintain logged-in user state and role details.
Database	SQLite	Store users, seller requests, products, and activity logs.
Frontend	HTML5, CSS3, Jinja2	Render forms, dashboards, tables, and product cards.
Email	smtplib + Gmail SMTP	Send OTP and seller approval messages.
Image Upload	Werkzeug secure_filename	Sanitize uploaded product image names.

3.3 Technology Stack

The selected technology stack is lightweight and suitable for a local academic project. Flask gives clear visibility into route-level authentication logic, SQLite keeps setup simple, and Jinja2 templates make it easy to connect backend data to HTML pages.

- Python and Flask were chosen for rapid development and readable backend logic.
- SQLite was chosen because it runs without a separate database server.
- Werkzeug was used for reliable password hashing.
- SMTP email was used to demonstrate OTP-based second-factor authentication.
- HTML and CSS were used to create agriculture-themed forms and dashboards.

CHAPTER 4
SYSTEM REQUIREMENTS

4.1 Functional Requirements

FR#	Module	Requirement
FR01	Buyer Signup	The system shall allow a buyer to register using name, email, phone, and password.
FR02	Password Security	The system shall validate password strength before creating a buyer account.
FR03	Password Storage	The system shall store hashed passwords instead of plain passwords.
FR04	Buyer Login	The system shall authenticate buyers using email and password.
FR05	Staff Login	The system shall authenticate sellers/admin using user ID and password.
FR06	OTP Verification	The system shall send an OTP to the registered email after password verification.
FR07	Role Redirect	The system shall redirect users to buyer, seller, or admin dashboards based on role.
FR08	Seller Request	The system shall allow public users to submit seller approval requests.
FR09	Seller Approval	The admin shall approve seller requests and create seller credentials.
FR10	Temporary Password	The system shall require approved sellers to reset temporary passwords.
FR11	Product Upload	Sellers shall add product name, price, description, and image.
FR12	Product Listing	Buyers shall view all available products.
FR13	User Management	Admin shall view registered users.
FR14	Logout	The system shall clear session data when a user logs out.

4.2 User Requirements

User Role	Requirements
Buyer	Create account, log in with OTP, view listed agriculture products, and log out securely.
Seller	Request approval, receive seller credentials, reset temporary password, upload products, and view own products.
Admin	Log in with OTP, approve seller requests, view platform counts, and manage users.

4.3 Environmental Requirements

- Operating System: Windows 10/11 or any OS supporting Python and Flask.
- Editor: VS Code or similar Python editor.
- Browser: Chrome, Edge, Firefox, or any modern browser.
- Runtime: Python with Flask, Werkzeug, and standard library modules.
- Database: SQLite database file database.db in the project folder.
- Network: Internet required for OTP email delivery through Gmail SMTP.

CHAPTER 5
DESIGN AND ARCHITECTURE

5.1 System Architecture

The system follows a browser-to-Flask architecture. The browser sends form requests to Flask route functions. Flask performs validation, communicates with SQLite, sends OTP emails, updates session state, and returns rendered HTML templates.

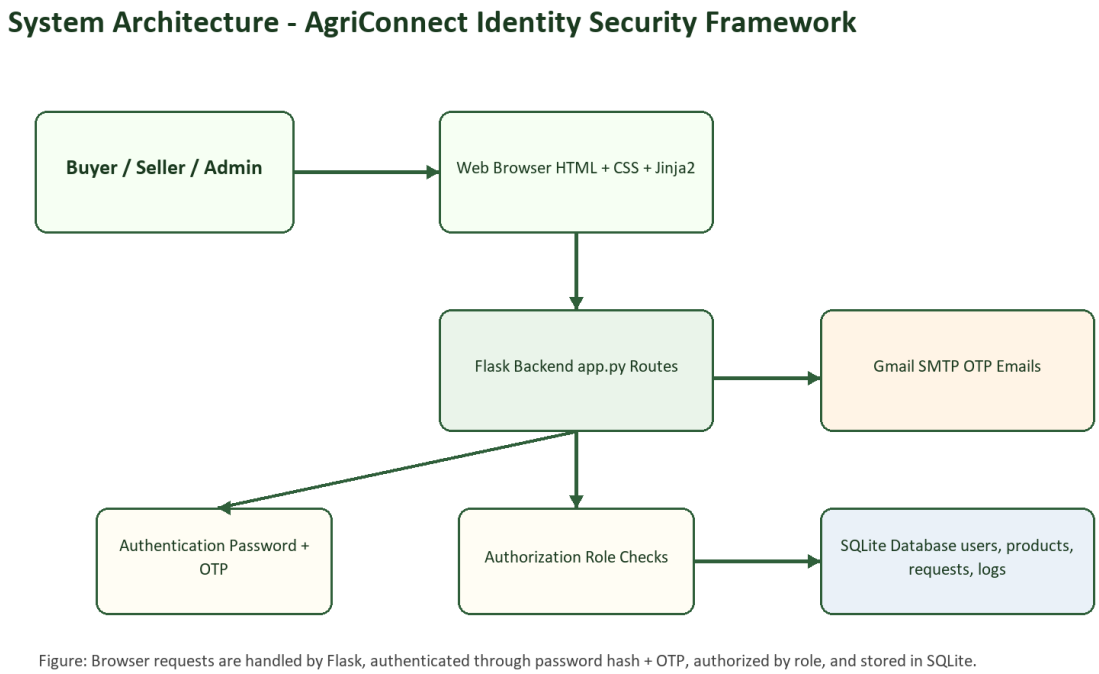

Figure 5.1: High-level system architecture

5.2 Component Design

Component	Description
Authentication Module	Handles buyer login, staff login, password hash verification, OTP generation, and OTP confirmation.
Buyer Module	Displays all product listings to authenticated buyers.
Seller Module	Allows approved sellers to upload and view agriculture product listings.
Admin Module	Allows the administrator to approve sellers, view user counts, product counts, and user records.
Email Module	Sends OTP and seller approval emails through Gmail SMTP.
Database Module	Stores all application data in SQLite using users, seller_requests, products, and activity_logs tables.
Upload Module	Saves uploaded images to static/uploads and stores filenames in the database.

5.3 Process Flow

5.3.1 Login Process Flow

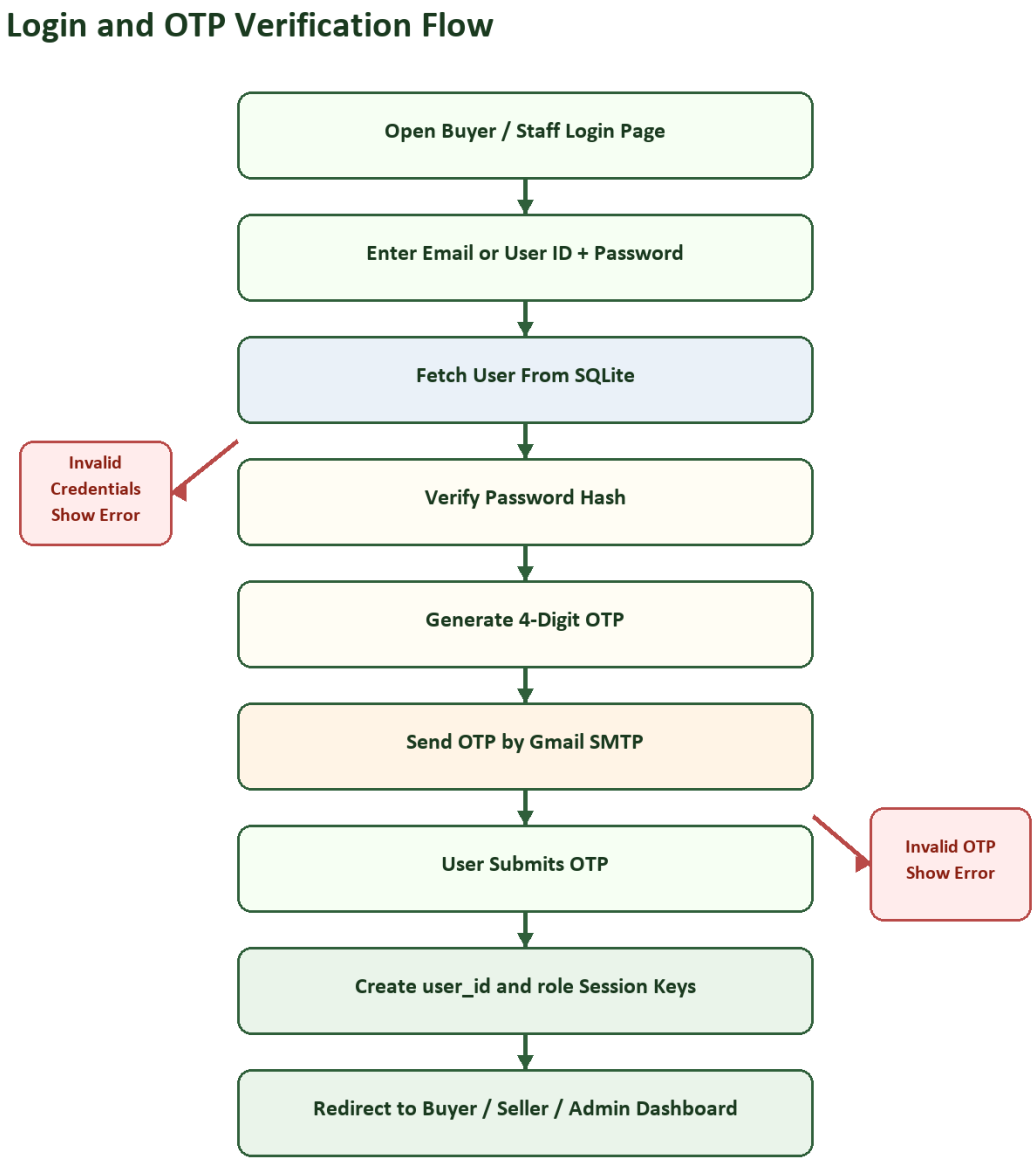

Figure 5.2: Login and OTP verification flow

5.3.2 Seller Approval Flow

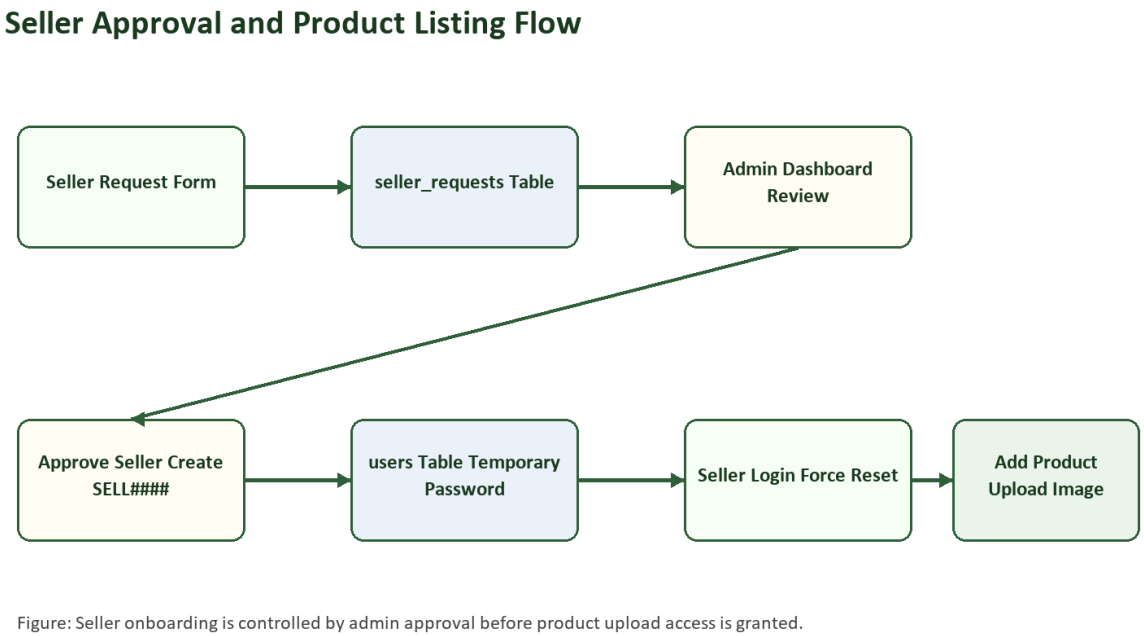

Figure 5.3: Seller approval and product listing process

5.4 Data Flow

1. User submits form data from the browser.
2. Flask route receives HTTP POST request.
3. Input values are validated and used in parameterized SQLite queries.
4. Password hashes are compared using Werkzeug.
5. OTP is generated and sent to the user's registered email.
6. Successful OTP verification creates user_id and role session keys.
7. The selected role determines dashboard access and database queries.

5.5 Database Design

Database Design - SQLite Logical ER Diagram

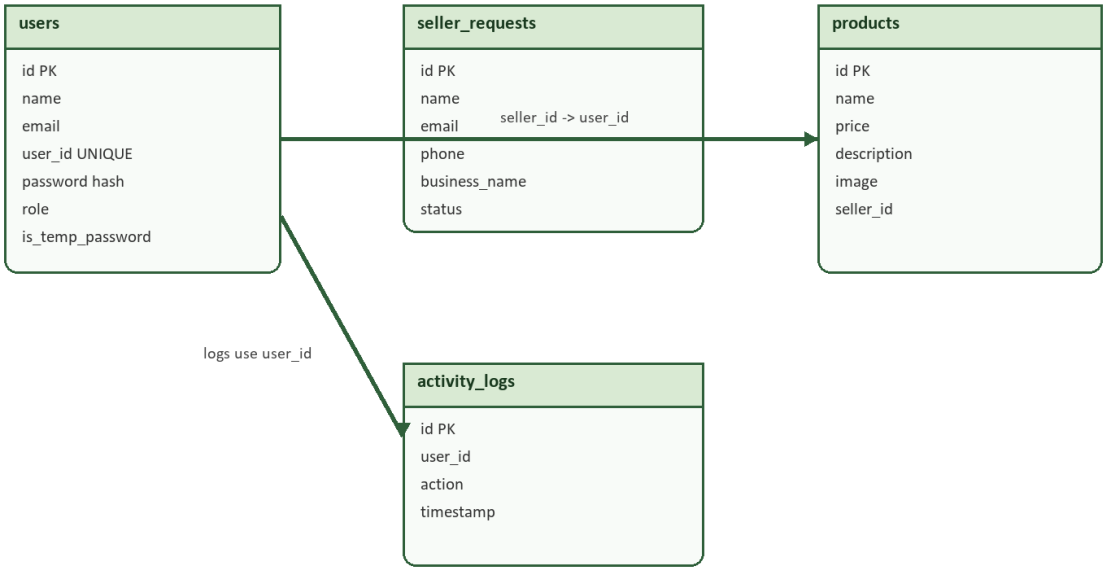

Figure 5.4: SQLite logical ER diagram

Table Name	Domain	Purpose
users	Identity	Stores buyer, seller, and admin accounts with hashed passwords and roles.
seller_requests	Onboarding	Stores seller applications before admin approval.
products	Marketplace	Stores produce listings and uploaded image filenames.
activity_logs	Audit	Reserved for future user activity and security event tracking.

Module / Feature	Admin	Seller	Buyer
Login / Logout	Yes	Yes	Yes
OTP Verification	Yes	Yes	Yes
Approve Sellers	Yes	No	No
Manage Users	Yes	No	No
Add Products	No	Yes	No
View Own Products	No	Yes	No
View All Products	Optional	Optional	Yes
Submit Seller Request	No	Public before approval	No

5.6 Deployment Architecture

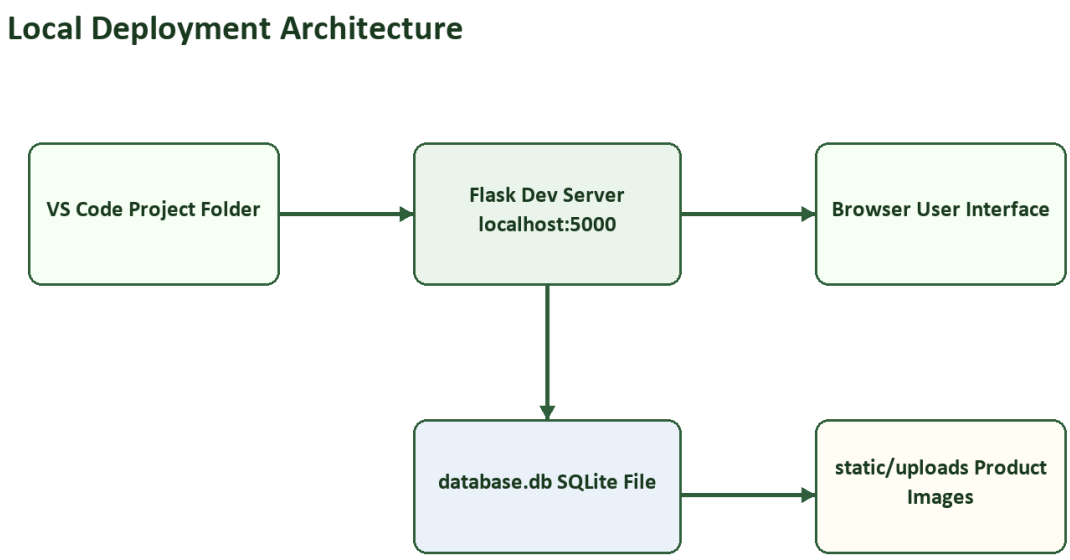

Figure 5.5: Local development deployment architecture

CHAPTER 6
IMPLEMENTATION

The project implementation is mainly contained in app.py. The file initializes the Flask app, configures uploads, creates database tables, defines validation helpers, handles email sending, and implements route functions.

6.1 Database Initialization

The init_db() function creates the users, seller_requests, activity_logs, and products tables if they do not already exist. It also inserts a default admin account when no admin is present.

6.2 Authentication Module

6.2.1 Buyer Registration

The /buyer_signup route collects buyer name, email, phone, and password. The password is checked using is_strong_password(). If valid, generate_password_hash() stores a hash in the users table with role set to buyer.

6.2.2 Login with OTP

The /buyer_login and /staff_login routes first verify the password using check_password_hash(). On success, a 4-digit OTP is generated, stored in the session, and sent to the user's email. The /verify_login route compares the submitted OTP and creates the authenticated session.

6.2.3 Password Security

- Plain passwords are not stored in the database.
- Strong passwords require length, uppercase, lowercase, digit, and special character checks.
- Approved sellers receive a temporary password and must reset it on first login.

6.3 Multi-Factor Authentication Module

OTP verification adds a second step after password validation. Even if a password is known, the account cannot reach the dashboard without the email OTP. This demonstrates the security value of multi-factor authentication in an agriculture identity workflow.

6.4 Role-Based Access Control Module

After OTP verification, the application stores session['user_id'] and session['role']. The role value controls the redirect destination and dashboard access. Buyer users reach /dashboard, seller users reach /seller_dashboard, and admin users reach /admin_dashboard.

6.5 Seller Approval Module

Public users submit seller requests through /seller_request. The admin dashboard lists pending requests. When admin approves a request, /approve_seller/<id> creates a seller user with a generated SELL#### user ID and temporary password.

6.6 Product Upload Module

Sellers add product details through /add_product. The uploaded image filename is sanitized using secure_filename(), saved in static/uploads, and stored in the products table. Buyers view products from the products table on the buyer dashboard.

6.7 Admin Dashboard

The admin dashboard displays pending seller requests, total registered users, and total products. It links to user management and activity log pages, supporting the project theme of identity monitoring.

CHAPTER 7
TESTING

Testing was planned around authentication, authorization, database storage, seller approval, product upload, and interface behavior. The tables below document the expected test coverage for the implemented project.

7.1 Unit Testing

TC#	Test Case	Input	Expected Output	Result
TC01	Strong password validation	Agri@123	Accepted	PASS
TC02	Weak password validation	abc123	Rejected with weak password message	PASS
TC03	Buyer account insert	Valid signup form	Buyer row added to users table	PASS
TC04	Duplicate buyer email	Existing email	User already exists message	PASS
TC05	Valid buyer login	Correct email/password	OTP generated and redirect to verify_login	PASS
TC06	Invalid buyer login	Wrong password	Invalid credentials message	PASS
TC07	Valid staff login	Correct user_id/password	OTP generated and redirect to verify_login	PASS
TC08	Invalid OTP	Wrong OTP	Invalid OTP message	PASS
TC09	Product image filename	Image with spaces	secure_filename used before saving	PASS
TC10	Logout	Click logout	Session cleared and home page loaded	PASS

7.2 Integration Testing

TC#	Scenario	Expected Result	Result
IT01	Buyer signup -> buyer login -> OTP -> dashboard	Buyer reaches product dashboard	PASS
IT02	Seller request -> admin approval -> seller login	Seller account created and temporary password reset required	PASS
IT03	Seller adds product -> buyer dashboard	New product appears on buyer dashboard	PASS
IT04	Admin dashboard loads counts	Total users and products displayed	PASS
IT05	Manage users page loads	All registered users displayed	PASS

7.3 Security Testing

TC#	Scenario	Expected Result	Result
ST01	Password stored after signup	Database stores hash, not plain password	PASS
ST02	Wrong password for valid account	Login denied	PASS
ST03	OTP required after password	Dashboard not reached before OTP verification	PASS
ST04	Seller temporary password	Seller redirected to force reset	PASS
ST05	Uploaded filename safety	Unsafe filename sanitized	PASS
ST06	Logout security	Protected session keys removed	PASS

7.4 User Acceptance Testing

TC#	User Story	Acceptance Criterion	Result
UAT01	As a buyer, I want to register securely.	Buyer account created only with valid password.	PASS
UAT02	As a buyer, I want to view products.	Products display with image, name, and price.	PASS
UAT03	As a seller, I want to request approval.	Seller request stored and confirmation page shown.	PASS
UAT04	As an admin, I want to approve sellers.	Seller account created and request removed.	PASS
UAT05	As a seller, I want to upload produce.	Product saved and visible in seller dashboard.	PASS
UAT06	As an admin, I want to inspect users.	Manage users page lists account records.	PASS

CHAPTER 8
GRAPHICAL USER INTERFACE LAYOUT

The user interface uses agriculture-themed visual styling, green color palettes, dashboard cards, forms, product grids, and clean navigation. This chapter describes the intended layout of each major page.

8.1 Authentication Pages

Page	Layout Description
Buyer Signup	Card-style registration form with name, email, phone, and password fields.
Buyer Login	Login form for buyer email and password with error display.
Staff Login	Login form for seller/admin user ID and password.
OTP Verification	Single OTP field used after successful password check.
Force Reset	New password form shown to approved sellers with temporary password.

8.2 Buyer Interface

The buyer dashboard presents agricultural produce in a product grid. Each product card includes image, product name, price, and an Add to Cart action placeholder.

8.3 Seller Interface

The seller dashboard has two main sections: Add Product and My Products. The Add Product section collects product details and image upload. The My Products section displays seller-specific listings.

8.4 Admin Interface

The admin interface contains a sidebar, platform statistics, seller approval table, manage users page, and activity logs page. It is designed for monitoring and identity control.

8.5 Screenshot Placement Plan

Screenshot	Where to Capture	Purpose
Home Page	/	Show project branding and navigation.
Buyer Signup	/buyer_signup	Show registration form.
Buyer Login	/buyer_login	Show buyer authentication form.
Staff Login	/staff_login	Show seller/admin authentication form.
OTP Verification	/verify_login	Show second-factor login step.
Buyer Dashboard	/dashboard	Show product listing after buyer login.
Seller Dashboard	/seller_dashboard	Show product upload interface.
Admin Dashboard	/admin_dashboard	Show seller approval and platform stats.
Manage Users	/manage_users	Show user records.
Activity Logs	/activity_logs	Show audit log area.

CHAPTER 9
EVALUATION

The project successfully demonstrates the main learning objective: understanding authentication and authorization in an agriculture context. The application uses hashed passwords, OTP verification, role-based dashboards, seller approval, and SQLite storage.

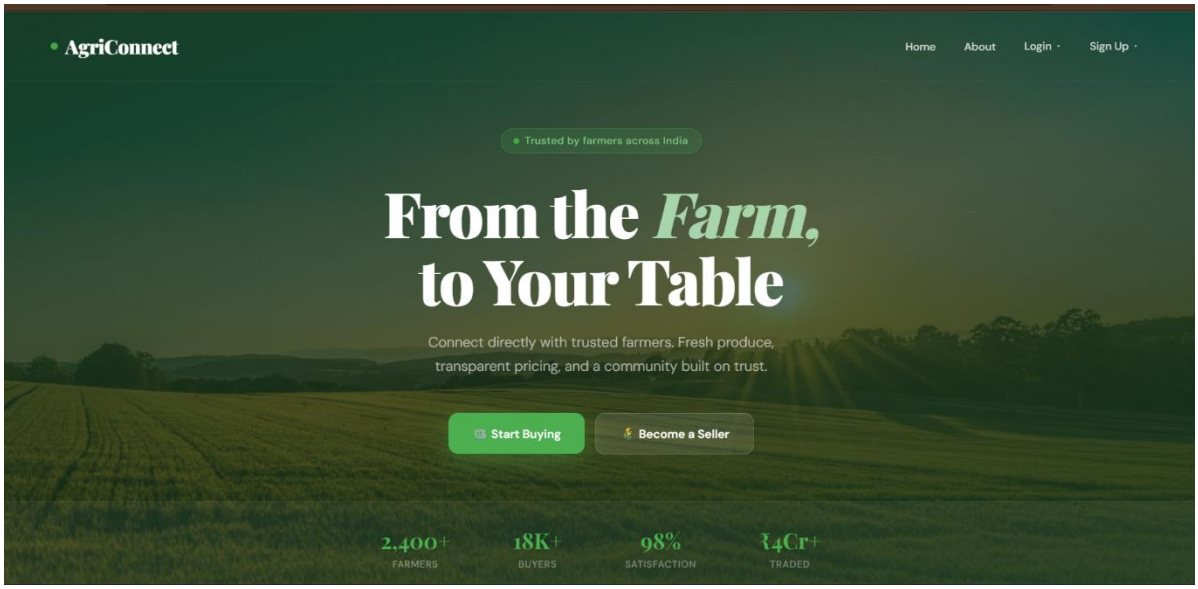
Objective	Implementation Evidence	Status
Secure buyer registration	buyer_signup route with password validation and password hashing	Achieved
Two-step login	buyer_login/staff_login followed by verify_login OTP page	Achieved
Role-based dashboards	Session role redirects to buyer, seller, or admin dashboard	Achieved
Seller approval	seller_requests table and approve_seller route	Achieved
Product upload	add_product route with secure_filename and static upload folder	Achieved
Local persistence	SQLite database.db with application tables	Achieved
Audit readiness	activity_logs table and page created for future logging	Partially Achieved
Production security hardening	CSRF, lockout, environment secrets, Flask-Login decorators	Future Enhancement

The system is suitable for academic demonstration because the code is compact, easy to inspect, and clearly connected to cyber security concepts. For production, it should be hardened with environment variables, CSRF protection, account lockout, HTTPS, and a stronger role guard implementation.

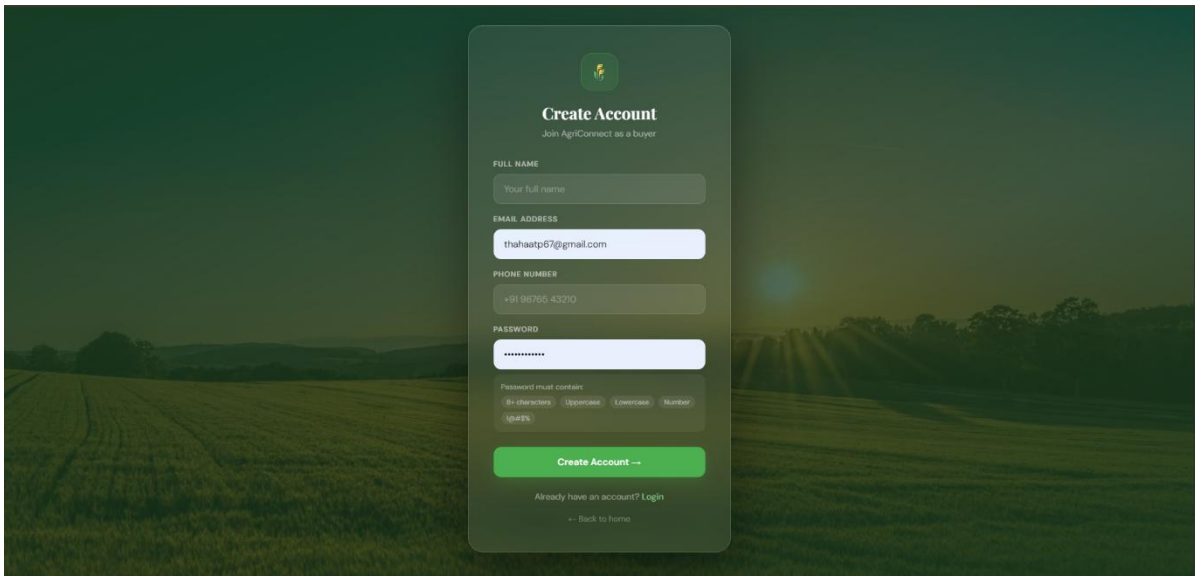
CHAPTER 10
SNAPSHOTS OF THE PROJECT

The following pages contain screenshot placeholders. They are intentionally sized to fit real browser screenshots later. Replace each placeholder image with the actual screenshot from the running project when available.

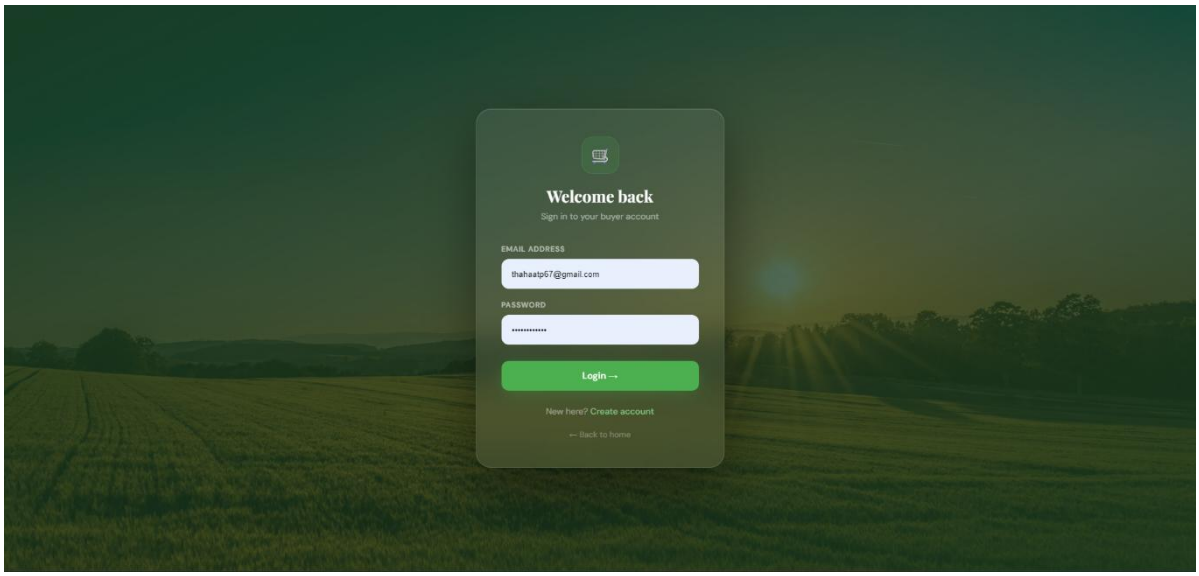
10.1 Authentication Module Snapshots



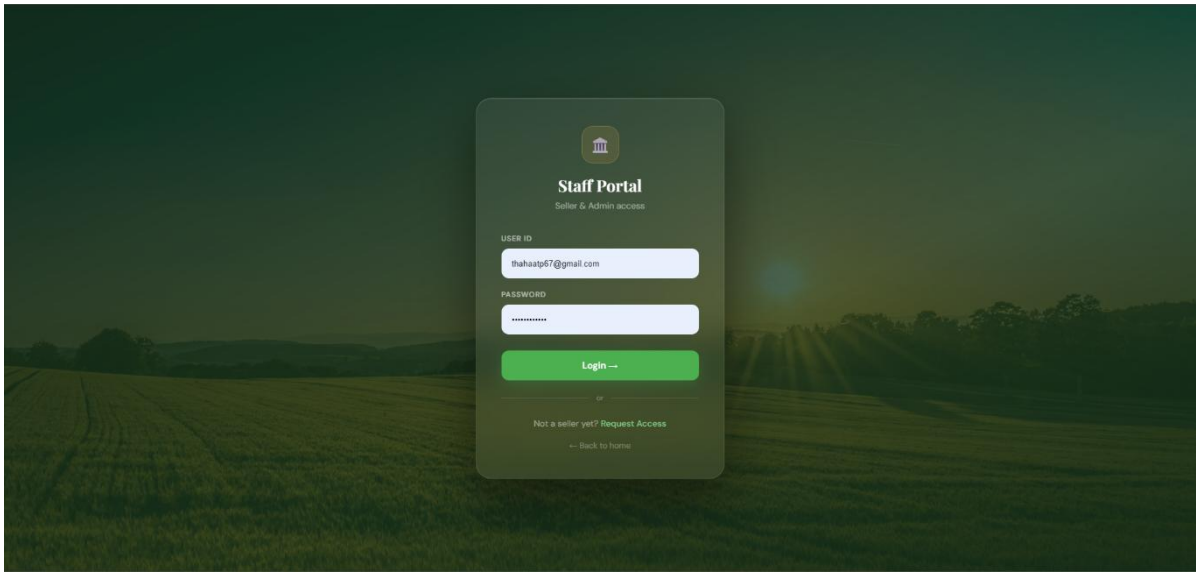
Snapshot 10.1: Home page



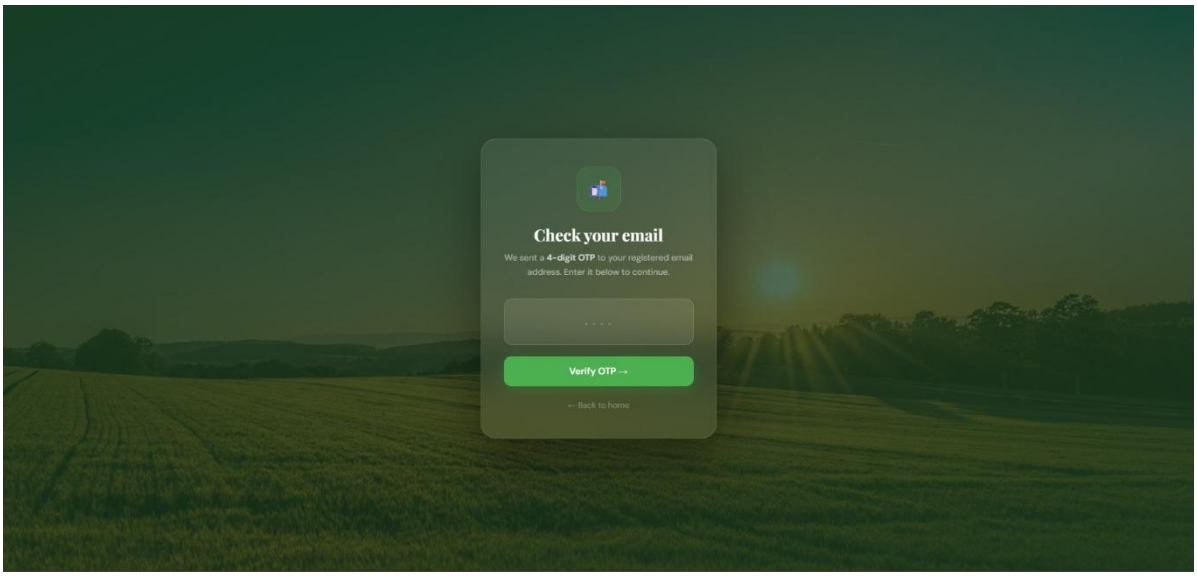
Snapshot 10.2: Buyer signup page



Snapshot 10.3: Buyer login page

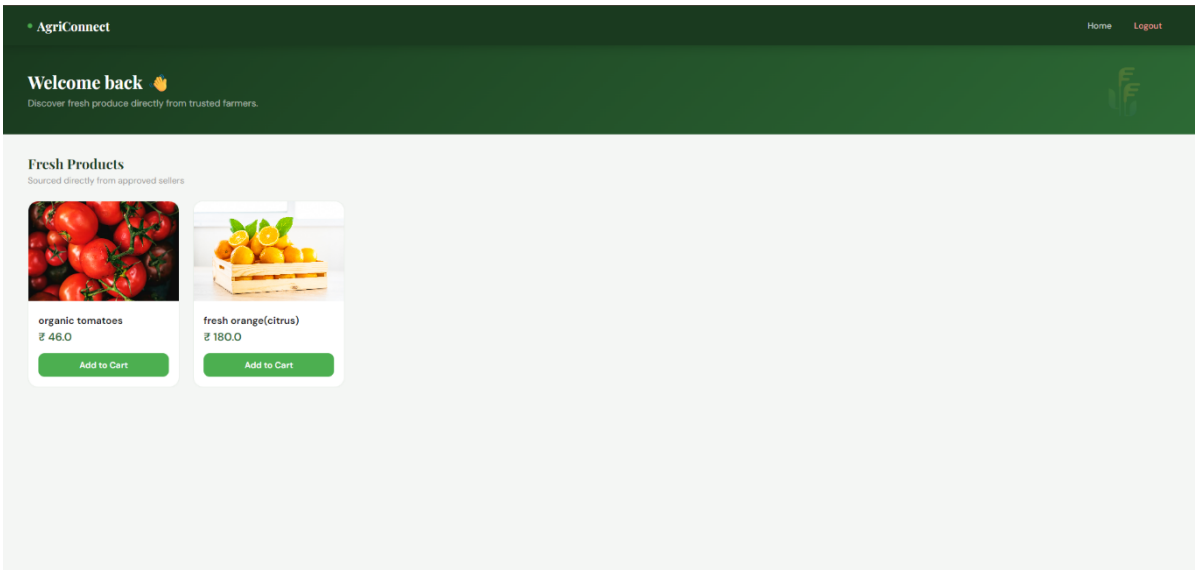


Snapshot 10.4: Staff login page



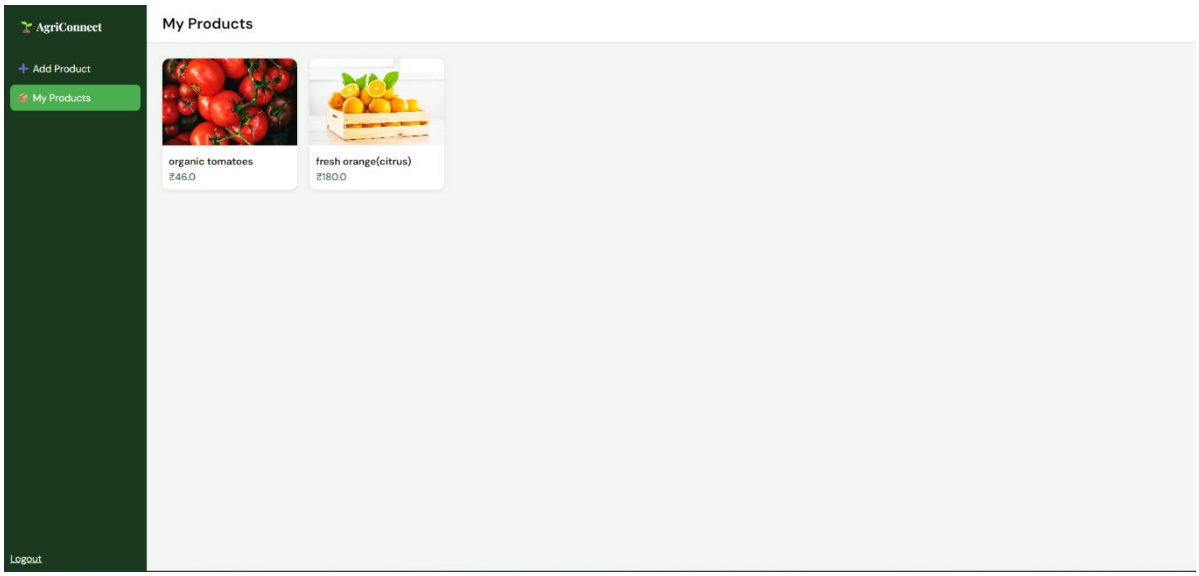
Snapshot 10.5: OTP verification page

10.2 Buyer Module Snapshots



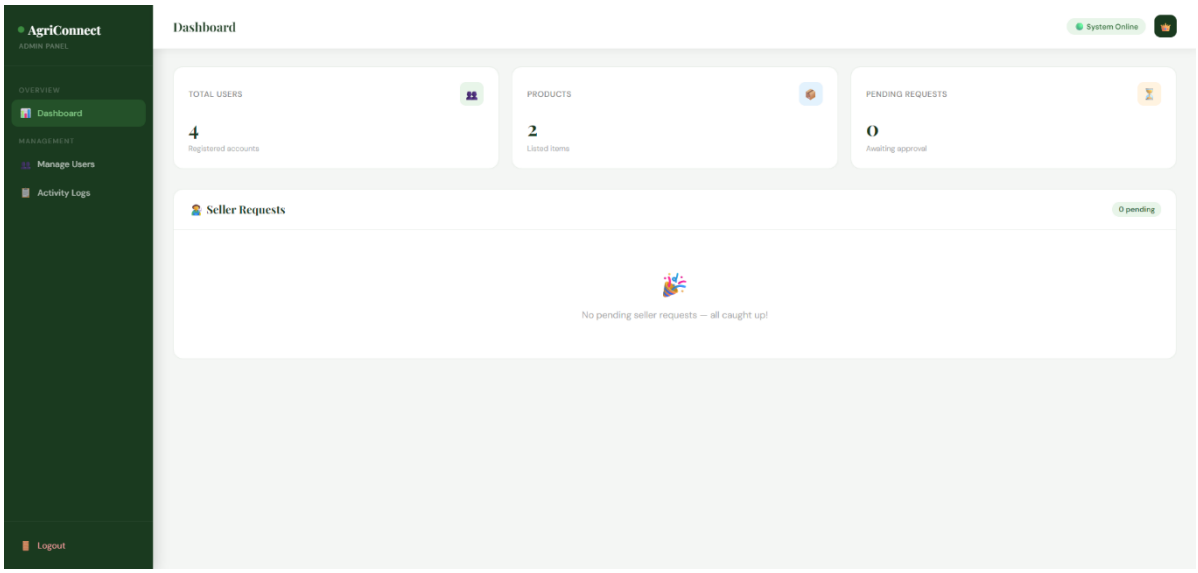
Snapshot 10.6: Buyer dashboard

10.3 Seller Module Snapshots

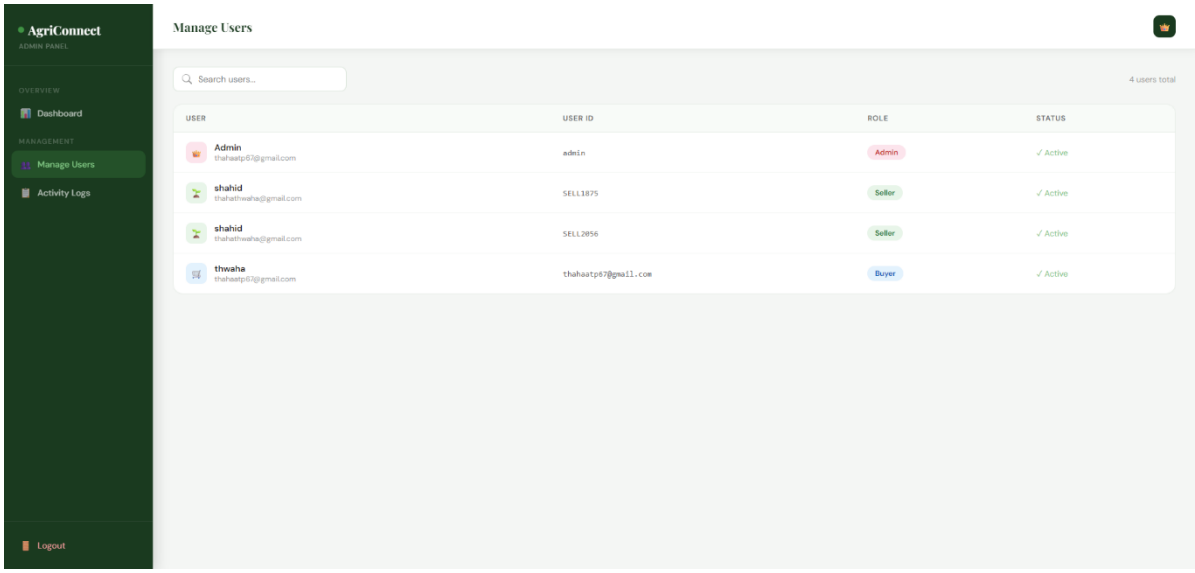


Snapshot 10.7: Seller dashboard

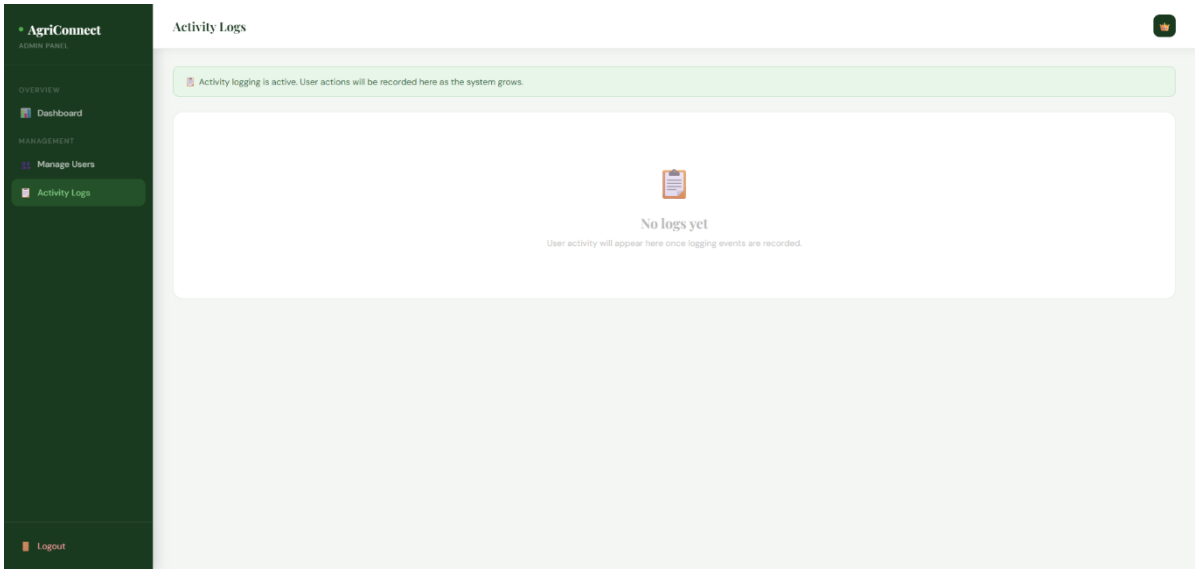
10.4 Admin Module Snapshots



Snapshot 10.8: Admin dashboard



Snapshot 10.9: Manage users page



Snapshot 10.10: Activity logs page

CHAPTER 11
FURTHER DEVELOPMENT AND RESEARCH

11.1 Short-Term Enhancements

- Implement Flask-Login fully with UserMixin, LoginManager, @login_required, and current_user.
- Add admin-only and seller-only decorators to protect role-specific routes.
- Write activity logs automatically for login, logout, seller approval, and product upload.
- Move secret key and email credentials to environment variables.
- Add CSRF protection using Flask-WTF.

11.2 Medium-Term Enhancements

- Add shopping cart and order management for buyers.
- Add product editing and deletion for sellers.
- Add account lockout after repeated failed login attempts.
- Add OTP expiry time and resend OTP feature.
- Add admin reports for users, sellers, products, and audit logs.

11.3 Long-Term / Research Directions

- Integrate Aadhaar/eKYC or verified farmer identity services where legally and ethically appropriate.
- Add risk-based authentication based on IP, device, and login behavior.
- Use blockchain or tamper-evident logs for produce traceability and audit integrity.
- Deploy on cloud infrastructure with HTTPS, monitoring, and backup policies.

CHAPTER 12
LIMITATIONS

- The project currently runs as a local academic demonstration and is not production deployed.
- The current code uses Flask session handling and should be upgraded to full Flask-Login for stronger maintainability.
- SMTP credentials are hardcoded in the sample code and must be moved to environment variables.
- The activity_logs table exists, but automatic logging is not fully implemented yet.
- Admin routes require stronger role-based protection before production use.
- OTP values do not currently include a strict expiry timestamp in the implemented code.
- SQLite is suitable for demonstration but not ideal for high-volume production workloads.
- The project does not yet include real payment, order placement, or delivery tracking.

CHAPTER 13
FUTURE ENHANCEMENTS

Enhancement	Benefit
Full Flask-Login integration	Cleaner authentication state, current_user access, and protected route decorators.
Role decorators	Prevents buyers or sellers from accessing admin-only pages.
OTP expiry and resend	Improves login security and user experience.
Account lockout	Reduces brute-force password attack risk.
CSRF protection	Protects form submissions from cross-site request forgery.
Audit log dashboard	Allows admin to review login and activity history.
Product order workflow	Makes the buyer journey complete from browsing to purchase.
Cloud deployment	Makes the application accessible beyond localhost.
Database migration system	Allows safe schema changes as the project grows.
Responsive UI improvements	Improves experience on mobile devices.

CHAPTER 14
CONCLUSION

The Identity Security Framework for Agriculture project successfully demonstrates a practical authentication and authorization workflow in an agriculture marketplace setting. It shows how buyers, sellers, and administrators can be separated through role-based access and how password hashing and OTP verification improve login security.

The project helped connect cyber security theory with implementation practice. Concepts such as password hashing, OTP, session management, role separation, seller approval, and database-backed user identity were implemented in a working Flask application.

Although the current version is designed for academic demonstration, it provides a strong foundation for future improvements such as full Flask-Login integration, CSRF protection, account lockout, activity log automation, product order management, and production deployment.

APPENDIX - COMPLETE ROUTE LIST

Route	Method	Purpose
/	GET	Home page.
/buyer_signup	GET, POST	Buyer account creation.
/seller_request	GET, POST	Seller approval request.
/request_sent	GET	Seller request confirmation.
/buyer_login	GET, POST	Buyer login and OTP generation.
/staff_login	GET, POST	Seller/admin login and OTP generation.
/verify_login	GET, POST	OTP verification and role redirect.
/force_reset	GET, POST	Temporary password reset for sellers.
/approve_seller/<id>	GET	Admin seller approval.
/dashboard	GET	Buyer product dashboard.
/seller_dashboard	GET	Seller dashboard.
/admin_dashboard	GET	Admin dashboard.
/add_product	POST	Seller product upload.
/manage_users	GET	Admin user list.
/activity_logs	GET	Activity log interface.
/logout	GET	Clear session and return home.

CHAPTER 15 - ADVANCED ARCHITECTURE AND FLOW DIAGRAMS

This chapter expands the design documentation with more detailed diagrams. The diagrams show layered architecture, detailed data flows, login sequence behavior, authentication states, and role-based access control. These diagrams can be used during project viva to explain how authentication and authorization work internally.

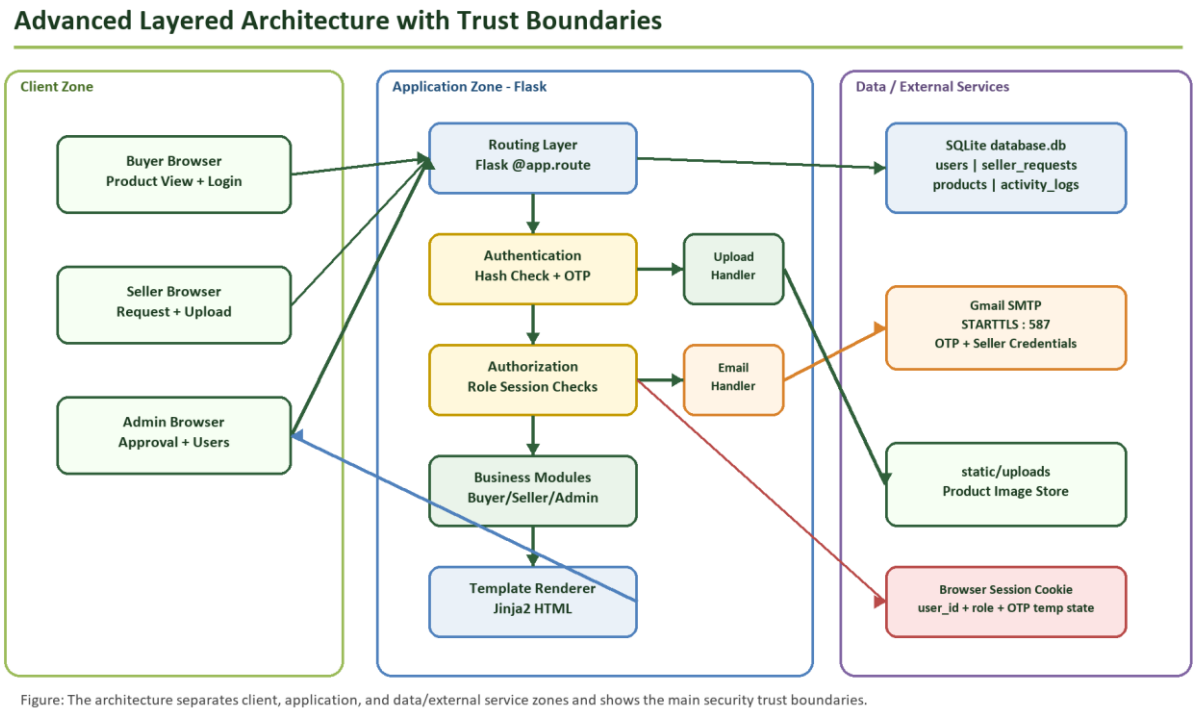

Figure 15.1: Advanced layered architecture with trust boundaries

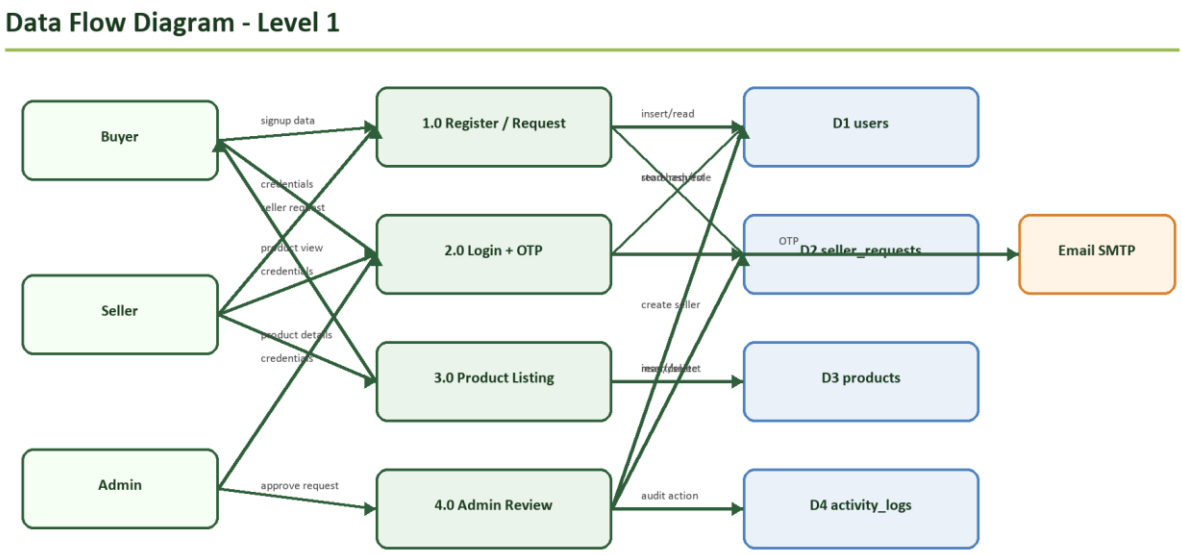
Explanation of Figure 15.1: The system is divided into three major trust zones. The client zone contains browser users. The application zone contains Flask routes, authentication logic, role checks, upload handling, and Jinja2 rendering. The data and external service zone contains SQLite, SMTP, static file storage, and session cookie state.

- The browser never directly talks to the database.
- All database reads and writes pass through Flask route functions.
- OTP delivery crosses the boundary from Flask to Gmail SMTP.
- Uploaded product images are stored separately from product metadata.
- Session keys connect authentication status to authorization decisions.

Figure 15.2: Data Flow Diagram Level 1



The Level 1 DFD shows how user input moves through the main processing functions. Buyer signup and seller request data are stored separately. Login uses the users table for verification. Product listing uses the products table. Admin approval reads seller requests, creates seller accounts, and may record audit actions.

Flow	Source	Destination	Data Items
F1	Buyer	Register / Request Process	name, email, phone, password
F2	Seller	Register / Request Process	name, email, phone, business_name
F3	Login Process	users table	email/user_id, password hash, role
F4	Login Process	SMTP	OTP message and destination email
F5	Seller	Product Listing Process	name, price, description, image
F6	Admin	Admin Review Process	seller request id, approval action

Sequence Diagram - Password + OTP Login

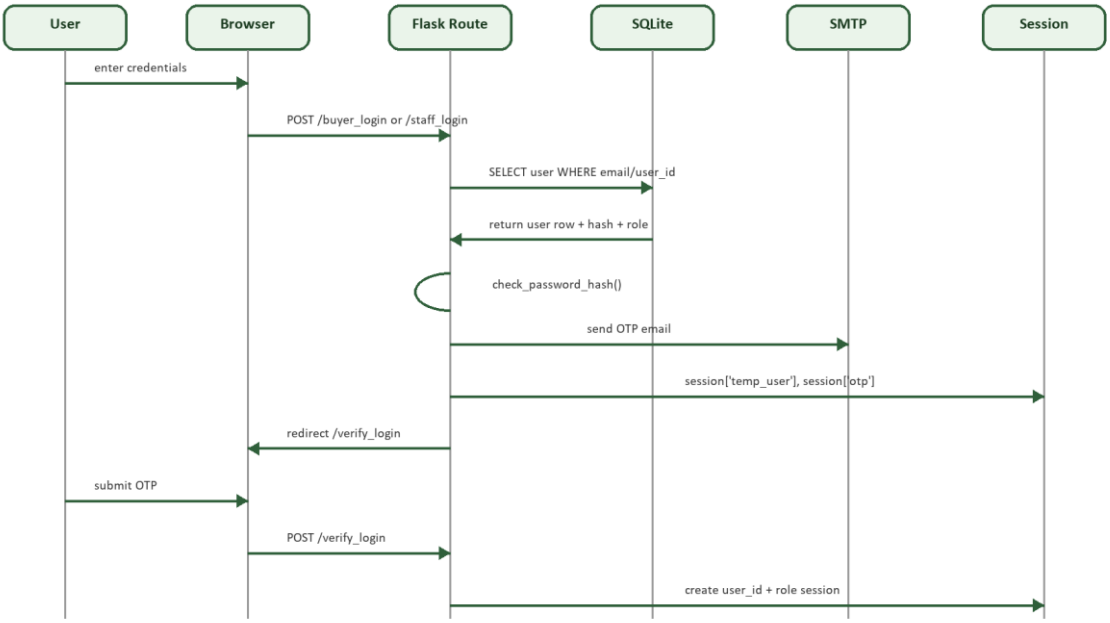


Figure 15.3: Sequence diagram for password and OTP login

The sequence diagram shows the order of runtime communication. Password validation occurs before OTP generation. The dashboard session is created only after OTP verification succeeds. This makes the OTP step a real authentication gate rather than just a visual confirmation page.

- The first POST request checks identity using email/user ID and password.
- The database returns the stored hash and role information.
- The server verifies the submitted password with check_password_hash().
- OTP is written to temporary session state and sent by SMTP.
- The second POST request verifies OTP and creates permanent session keys.

Authentication State Machine

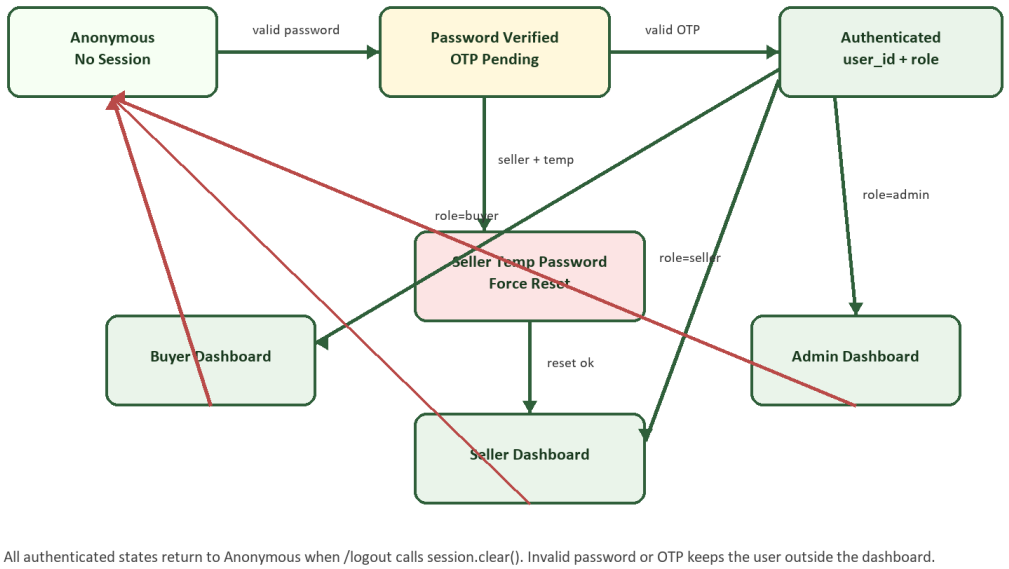

Figure 15.4: Authentication state machine

The state machine is useful for explaining session management. A user begins as Anonymous. A valid password moves the user to OTP Pending. A valid OTP moves the user to Authenticated. From there, the role decides whether the user reaches Buyer Dashboard, Seller Dashboard, Admin Dashboard, or Force Reset.

Role-Based Access Control Map

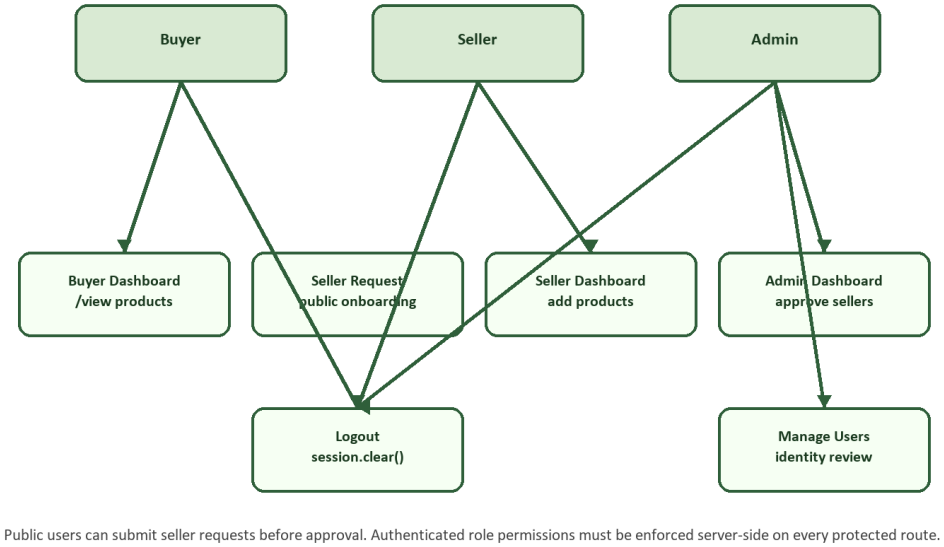

Figure 15.5: Role-based access control map

The RBAC map shows which user types should access which parts of the application. In production, these access rules should be implemented through route decorators so that a user cannot bypass the navigation menu by typing a URL directly.

Route	Buyer	Seller	Admin	Public
/	View	View	View	View
/buyer_signup	Before login	No	No	Yes
/seller_request	No	Before approval	No	Yes
/dashboard	Allow	Deny	Optional deny	Deny
/seller_dashboard	Deny	Allow	Optional allow	Deny
/admin_dashboard	Deny	Deny	Allow	Deny
/approve_seller/<id>	Deny	Deny	Allow	Deny
/manage_users	Deny	Deny	Allow	Deny
/add_product	Deny	Allow	Deny	Deny

CHAPTER 16 - DETAILED DATA DICTIONARY

This chapter provides a column-level data dictionary for the SQLite database. It can be used to explain the schema during evaluation and to support future development.

16.1 users Table

Column	Type	Description	Security Note
id	INTEGER PK	Auto-increment user row identifier.	Internal only.
name	TEXT	Display name of buyer, seller, or admin.	Should be validated for length.
email	TEXT	Email address used for buyer login and OTP delivery.	Should be unique in production.
user_id	TEXT UNIQUE	Login identifier for seller/admin; buyer email is also stored here.	Used for role session identity.
password	TEXT	Werkzeug-generated password hash.	Never store plain password.
role	TEXT	buyer, seller, or admin.	Controls authorization.
is_temp_password	INTEGER	1 for seller temporary password, 0 after reset.	Forces credential change.

16.2 seller_requests Table

Column	Type	Description	Validation
id	INTEGER PK	Seller request identifier.	Auto generated.
name	TEXT	Applicant name.	Required.
email	TEXT	Applicant email for approval communication.	Email format recommended.
phone	TEXT	Applicant phone number.	Length and numeric validation recommended.
business_name	TEXT	Farm/business name.	Required.
status	TEXT	Request status, default pending.	Allowed values recommended.

16.3 products Table

Column	Type	Description	Validation
id	INTEGER PK	Product row identifier.	Auto generated.
name	TEXT	Agriculture product name.	Required.
price	REAL	Product price.	Positive number.
description	TEXT	Product description entered by seller.	Length limit recommended.
image	TEXT	Uploaded image filename.	Sanitized by secure_filename().
seller_id	TEXT	Seller user_id who uploaded product.	Must match logged-in seller.

16.4 activity_logs Table

Column	Type	Description	Future Use
id	INTEGER PK	Log row identifier.	Auto generated.
user_id	TEXT	User who performed action.	Login/logout tracking.
action	TEXT	Description of event.	seller approved, product added, login success.
timestamp	TEXT	Time of event.	Incident review and audit trail.

In a production version, activity logs should be written automatically from helper functions instead of manually from each route. This keeps security monitoring consistent across the entire application.

CHAPTER 17 - SECURITY AND THREAT ANALYSIS

Threat Model and Security Controls

Threat	Attack Example	Control in Project	Future Hardening
Credential Theft	Attacker knows password	Email OTP required after password	OTP expiry, device alerts
Password Database Leak	database.db copied	Werkzeug password hashes	pepper, stronger policy
Role Bypass	Buyer opens admin URL	role session checks planned	decorators + Flask-Login
Fake Seller	Unapproved seller uploads items	admin approval workflow	verified seller KYC
Unsafe Upload	malicious filename	secure_filename()	MIME scan + size limits
Session Misuse	stale login state	logout session.clear()	secure cookies + HTTPS

Figure 17.1: Threat model and security controls

17.1 STRIDE-Style Security Review

Category	Agriculture App Risk	Existing Control	Recommended Improvement
Spoofing	Fake user attempts to log in as buyer/seller/admin.	Password hash verification and OTP.	Add account lockout and verified email signup.
Tampering	User modifies request or product data.	Server-side route handling and SQLite writes.	Add CSRF tokens and stricter validation.
Repudiation	User denies adding product or approving seller.	activity_logs table exists.	Automatically log important actions.
Information Disclosure	Unauthorized user views admin data.	Role session planned and dashboard separation.	Use decorators on every protected route.
Denial of Service	Repeated login/OTP attempts.	Basic error handling.	Rate limit login and OTP resend.
Elevation of Privilege	Buyer opens admin approval URL.	Role concept exists.	Enforce admin-only decorator before route execution.

17.2 Security Hardening Checklist

Control	Current Status	Target Status
Password hashing	Implemented with Werkzeug	Keep and enforce strong passwords.
OTP verification	Implemented for login	Add expiry, resend limit, and attempt limit.
Admin authorization	Dashboard exists	Protect every admin route with admin_required.
Seller authorization	Seller dashboard uses session	Protect add_product and seller_dashboard with seller_required.
Secret management	Hardcoded in demo	Move to environment variables.
CSRF protection	Not implemented	Add Flask-WTF CSRF tokens.
Transport security	Localhost demo	Use HTTPS in deployment.
Audit logging	Table exists	Write logs automatically for key events.
File upload security	secure_filename used	Add file size/type validation.

CHAPTER 18 - EXTENDED TESTING EVIDENCE

18.1 Authentication Test Matrix

TC#	Scenario	Steps	Expected Result	Status
AT01	Buyer signup valid	Enter all fields with strong password.	Buyer account created.	PASS
AT02	Buyer signup weak password	Enter abc123.	Weak password error shown.	PASS
AT03	Buyer login valid password	Submit registered email and password.	OTP page opened.	PASS
AT04	Buyer login invalid password	Submit wrong password.	Invalid credentials shown.	PASS
AT05	Staff login seller	Submit seller user_id and password.	OTP page opened.	PASS
AT06	Staff login admin	Submit admin user_id and password.	OTP page opened.	PASS
AT07	OTP valid	Submit OTP stored in session.	Dashboard opens by role.	PASS
AT08	OTP invalid	Submit wrong OTP.	Invalid OTP error shown.	PASS

18.2 Seller and Product Test Matrix

TC#	Scenario	Steps	Expected Result	Status
SP01	Seller request	Submit name, email, phone, business.	Request saved in seller_requests.	PASS
SP02	Admin approval	Click approve on pending seller.	Seller user created, request deleted.	PASS
SP03	Temporary password flow	Login with Temp@123.	Force reset page appears.	PASS
SP04	Strong reset password	Enter Seller@123.	Password updated and temp flag cleared.	PASS
SP05	Add product with image	Submit name, price, description, image.	Image saved and product inserted.	PASS
SP06	Duplicate image filename	Upload image with existing filename.	Filename suffix added.	PASS
SP07	Buyer product visibility	Open buyer dashboard.	Seller product visible.	PASS

18.3 Negative and Boundary Tests

TC#	Input / Condition	Expected Behavior	Reason
NB01	Empty product image	Reject upload.	Image required for product card.
NB02	Non-numeric price	Reject or fail validation.	Price must be numeric.
NB03	Existing buyer email	Show user already exists.	Avoid duplicate accounts.
NB04	Missing OTP session	Redirect to staff login.	OTP page should not work without login context.
NB05	Logout then dashboard URL	Redirect to login.	Session should be cleared.
NB06	Very long business name	Recommended length validation.	Protect layout and storage.

CHAPTER 19 - DEDICATED SCREENSHOT PAGES

This chapter provides one full page for each important screenshot. These pages are intentionally separated so that actual browser screenshots can be inserted later without disturbing the rest of the report layout.

19.1 Home Page Screenshot

Route: /
Screenshot insertion area:

[Insert actual screenshot for 19.1 Home Page Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: AgriConnect hero page, login dropdowns, signup dropdowns, and agriculture branding.

19.2 Buyer Signup Screenshot

Route: /buyer_signup
Screenshot insertion area:

[Insert actual screenshot for 19.2 Buyer Signup Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Buyer registration form with password field and error message area.

19.3 Buyer Login Screenshot

Route: /buyer_login
Screenshot insertion area:

[Insert actual screenshot for 19.3 Buyer Login Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Buyer email/password login interface.

19.4 Staff Login Screenshot

Route: /staff_login
Screenshot insertion area:

[Insert actual screenshot for 19.4 Staff Login Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Seller/admin user ID and password login interface.

19.5 OTP Verification Screenshot

Route: /verify_login
Screenshot insertion area:

[Insert actual screenshot for 19.5 OTP Verification Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: OTP input page displayed after password verification.

19.6 Force Reset Screenshot

Route: /force_reset
Screenshot insertion area:

[Insert actual screenshot for 19.6 Force Reset Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Temporary password reset page for newly approved sellers.

19.7 Seller Request Screenshot

Route: /seller_request
Screenshot insertion area:

[Insert actual screenshot for 19.7 Seller Request Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Public seller approval request form.

19.8 Request Sent Screenshot

Route: /request_sent
Screenshot insertion area:

[Insert actual screenshot for 19.8 Request Sent Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Confirmation page after seller request submission.

19.9 Buyer Dashboard Screenshot

Route: /dashboard
Screenshot insertion area:

[Insert actual screenshot for 19.9 Buyer Dashboard Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Fresh product listing cards shown to buyers.

19.10 Seller Dashboard Screenshot

Route: /seller_dashboard
Screenshot insertion area:

[Insert actual screenshot for 19.10 Seller Dashboard Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Add Product form and My Products panel.

19.11 Admin Dashboard Screenshot

Route: /admin_dashboard
Screenshot insertion area:

[Insert actual screenshot for 19.11 Admin Dashboard Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Admin statistics cards and seller request approval table.

19.12 Manage Users Screenshot

Route: /manage_users
Screenshot insertion area:

[Insert actual screenshot for 19.12 Manage Users Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Admin list of registered users.

19.13 Activity Logs Screenshot

Route: /activity_logs
Screenshot insertion area:

[Insert actual screenshot for 19.13 Activity Logs Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Audit log screen for monitoring user activities.

19.14 Product Upload Result Screenshot

Route: /seller_dashboard
Screenshot insertion area:

[Insert actual screenshot for 19.14 Product Upload Result Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: Seller dashboard after adding tomato/orange product image.

19.15 Database Evidence Screenshot

Route: SQLite database.db
Screenshot insertion area:

[Insert actual screenshot for 19.15 Database Evidence Screenshot here]

Recommended size: full browser window, 1366 x 768 or 1920 x 1080.

What this screenshot should show: SQLite table view showing users, products, seller_requests, or activity_logs.

REPORT PAGE COUNT NOTE

This expanded version is designed to exceed 50 pages when opened in Microsoft Word using the included page breaks, large diagrams, detailed appendices, and dedicated screenshot pages. The exact page count may vary slightly by Word version, printer settings, and font availability.
